

## ① Concept of Inflation

- Inflation is loss in purchasing power of money over time i.e. cost of an item tends to increase over time.
- If consumers of an economy came to know that prices are going to increase in coming future then they will over purchase the good this will cause shortage of various goods in the market.

## # 8.2 Measuring Inflation

- The consumer price index (CPI) compares the cost of typical market basket of goods and services in a current month with each cost one month, one year.
- The point in the past to which current prices are compared are called base period.
- Market basket normally consist of items from several group such as :
  - i) Food and alcoholic beverage
  - ii) Housing, transportation
  - iii) Medical care, personal care, entertainment etc.

## ① Consumer price Index (CPI)

→ The CPI measure average change in prices paid for food, ~~clat~~ shelter, medical care, transportation and other goods and services used by individual or families.

## ② Producer price index (PPI)

→ It is good measure of the industrial price increase. It is also called as whole price Index

## ③ Wholesale price Index (WPI)

→ It measures and tracks the changes in the price of goods in the stage before the retail level.

## ④ GDP deflator

→ GDP stands for gross domestic product the total value of all financial goods and services produced within that economy during a specified period.

## # Equivalence calculation under inflation

① market interest rate ( $i$ )

→ It is the all interest rate started by financial institution for loan and saving account.

② Actual (~~cur~~) (current) cash flow ( $A_n$ )

→ It is the actual cash flow (paid) at the time purchasing good and services.

③ constant (real) cash flow ( $A_n'$ )

→ It is the inflation-free / constant cash flow from the effect of inflation or deflation.

④ inflation rate ( $f$ )

→ measure rate of change in the value of money.

(eq<sup>n</sup>)

⑤ Inflation free interest rate ~~( $i$ )~~ - Real or constant dollar

→ It is the rate in which the inflation effect have been removed. It is known as real interest rate and can be computed when the market interest rate and inflation

# rate are given.

# Conversion from constant to actual cash flow

actual  $\rightarrow$   $A_n = A_n' (1+f)^N$

$\swarrow$  future       $\swarrow$  present       $\swarrow$  inflation rate  
 constant cash flow

# Conversion from actual to constant cash flow.

$$A_n' = \frac{A_n}{(1+f)^N}$$

$q \rightarrow$  inflation free interest rate  
 $i =$  market interest rate  
 $f =$  inflation rate

# Adjusted discounted method

$$A_n' = \frac{A_n}{(1+f)^N (1+q)^N}$$

$$q = \frac{q - f}{1 + f}$$

# calculation inflation free interest rate, when inflation rate is 5% and market interest rate is 13% per year.

soln:

$$i' = ? \quad f = 5\% \quad i = 13\%$$

$$i' = \frac{i - f}{1 + f} = \frac{0.13 - 0.05}{1 + 0.05}$$

$$= \frac{0.08}{1.05}$$

$$= 7.61\%$$

# Find rate of inflation when price of a product has increased from Rs 5,00,000 to Rs 6,30,000 over the period of 3 yrs.

$$A_n = A_n' (1 + f)^n$$

$$6,30,000 = 5,00,000 (1 + f)^3$$

$$f = 0.08 = 8\%$$

- # Calculate the equipment pw at the project from the following cash flow. Assume inflation for interest rate as 5% and inflation as 10% respectively.

Soln:-

$$P_1 = \frac{P - P_1}{1 + i}$$

$$0.05 = \frac{i - 0.1}{1 + 0.1}$$

$$i = 0.155 \text{ (market interest rate)}$$

Now,

convert all to pw
